

# Biology Topic 4: Bioenergetics

1. Photosynthesis	
$6\text{CO}_2 + 6\text{H}_2\text{O} \xrightarrow[\text{Chlorophyll}]{\text{Sunlight}} \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$ <p>Carbon Dioxide + Water <math>\xrightarrow[\text{Chlorophyll}]{\text{Sunlight}}</math> Glucose + Oxygen</p>	
Photosynthesis	An endothermic reaction where sunlight is absorbed and used to convert carbon dioxide and water into glucose and oxygen
Uses of glucose	<ul style="list-style-type: none"> <li>• Respiration</li> <li>• Converted into starch</li> <li>• Produce fat or oil</li> <li>• Produce cellulose cell walls</li> <li>• Produce amino acids</li> </ul>

2. Rate of photosynthesis		
Factor	Affect on photosynthesis	Reason
Light	Increases	More energy for the reaction
Carbon dioxide	Increases	More reactants (provided there is no limiting reactant)
Amount of chlorophyll	Increases	More energy for the reaction
Temperature	Increases then decreases	Initially more energy but then enzyme denatures
Limiting factor	The factor that can limit the rate of a reaction	

### 3. Aerobic respiration

Respiration	An exothermic reaction which continuously happens in living cells
Purpose	Transfer energy for: <ul style="list-style-type: none"> <li>• Chemical reactions</li> <li>• Movement</li> <li>• Warmth</li> </ul>
Aerobic	With oxygen

Anaerobic	Without oxygen
Anaerobic respiration in muscle cells	glucose $\rightarrow$ lactic acid
Anaerobic respiration in yeast cells (fermentation)	glucose $\rightarrow$ ethanol + carbon dioxide
Lactic acid	A chemical that when built up in muscles causes fatigue
Oxygen debt HT ONLY	The amount of oxygen the body needs after exercise to remove the lactic acid

### 4. Response to exercise

Change	Reason
Heart pumps faster	Supply more oxygenated blood to the muscles
Breathing rate increases	
Deeper breaths	

### 5. Metabolism

Metabolism	The sum of all the reactions in a cell or the body
Includes:	<ul style="list-style-type: none"> <li>• Conversion of glucose to starch, glycogen and cellulose</li> <li>• Formation of lipids from glycerol and 3 fatty acids</li> <li>• Use of glucose and nitrates to make proteins (PLANTS)</li> <li>• Respiration</li> <li>• Breakdown of protein to form urea.</li> </ul>
